GENTEC® Company Overview

Company Overview

Genstar Technologies is a global leader in Gas Flow Control Systems for the industrial, specialty gas and medical sectors. We pride ourselves in our ability to provide our customers with high quality, value-added products and services that go beyond the industry standards. As a result, we have a global network of thousands of satisfied customers in over 60 countries.

Our Team

Our highly educated team of engineers, salespeople, technicians, managers, and customer service personnel are dedicated to providing you with products with the highest quality, reliability and performance. We hold the highest standards to our manufacturing processes; our total process management maximizes our production efficiency while ensuring product quality.

We work closely with all of our customers to design products specific to your needs. This includes developing new products, redesigning existing products, and customizing configuration / packaging. It is our priority to foster a strong relationship with each and every customer.

Quality Assurance

All of our products are manufactured under stringent quality control. We are ISO 9001:2001, ISO13485, and API certified. Our products meet UL, CE, SEMI, and various international standards and certifications.

Manufacturing Capabilities

The manufacturing facility is equipped with CNC machines, electro-polishing equipment, and precision automated orbital welding systems, among other features, to ensure the production of the highest quality products.

Clean Room Facilities

Our class 10/100/1000 clean rooms are designed for Ultra High Purity (UHP) products. UHP products undergo precision machining, surface finishing, electro-polishing and passivation. All UHP products are cleaned by 18MΩ DI water in a cascade ultrasonic tank. To ensure the highest UHP product quality, they are then vacuum-dried and double-bagged.

Excess Flow Valves

GENTEC® Valves

Used in pipeline system to stop uncontrolled release of system media in the event of a downstream gas line rupture or disconnection, thereby saving the media and guaranteeing the system safety.

Operating Principles

The spring-loaded poppet remains in the open position during system operation. If an excess flow occurs downstream, i.e. a pressure drop, the poppet rapidly moves to the cutoff position to block all uncontrolled flow. When the pressure is balanced once again, the poppet will automatically revert to the original (open) position.

Pressure-Temperature Ratings

The nominal pressure depends on the end connections

Product Selection

Excess flow valves are used to prevent uncontrolled release of flow in the event of a gas line rupture or disconnection. The excess flow valves are intended to close upon excess flow of gas and remain closed until the system equalizes.

Selection Guideline:

- EV12 Excess Flow Valve: When inlet pressure is 60 bar with peak flow rate of 50 m³/h. The intersection point on the chart above lies within the Low Flow section. The proper cracking pressure range should be medium flow or the standard flow. A low flow range selection would have a risk of the excess flow valve reducing or shutting the flow during normal system operation.
- EV 13 Excess Flow Valve: When inlet pressure is 20 Bar with peak flow rate of 100 m³/h and a system restriction flow 300m³/h. The two intersection points are within the low flow and standard flow range. Therefore select an excess flow valve with medium flow trip range which can not only avoid nuisance tripping, but also ensure effective performance under flow restriction condition.
- EV 14 Excess Flow Valve: When inlet pressure is 15 bar with peak flow rate of 240 m³/h. The intersection point is within the medium flow range. Therefore select an excess flow valve with standard flow. In systems that contain restriction devices—such as pressure regulators, flow control valves and reducing pipes, the flow through the rupture might not be sufficient enough to reach the flowrate required to trip the excess valve. In these cases, excess valves with medium flow and low flow trip range should be selected.
